## Summary

<b>description</b>	<p><b>English:</b> Figure 4 Variations in mid-Westphalian A to top Westphalian B palaeoenvironments, north to south through eastings 470- 480. As for Figure 3, the vertical axis is the geological succession normalized for regional thickness variations to give a timeequivalent display (see main text); the horizontal axis is a north-south section through the succession; see Figure 5 for location. Again, the suppression of actual thickness variations allows a more ready assessment of the spatial variations in timeequivalent environments. Note: the unions of coals towards the basin margin southeast of Nottingham; basin-marginal areas where late Westphalian B marine strata occupy a specific condensed succession; the general lateral continuity of the named coals; and the persistence of channel belts, evidenced by significant fluvial sandstones throughout most of the succession. See also the caption for Figure 3.</p> <p>From: <a href="#">Carboniferous hydrocarbon resources: the southern North Sea and surrounding onshore areas</a>, edited by J. D. Collinson, D. J. Evans, D. W. Holliday, N. S. Jones. Published as volume 7 in the Occasional Publications series of the <a href="#">Yorkshire Geological Society</a>, Copyright <a href="#">Yorkshire Geological Society</a> 2005.</p>
